```
3.4.1 === major.minor.patch
```

- Major
    - New feature which may potentially cause breaking changes to applications dependent on the previous major version.
- Minor
    - New features that do not break the existing API
- Patch
    - Bug fixes for the current minor version

Glob patterns for versioning

Caret

Interested in any version so long as the major version remains at n. E.g if we are at `^4.2.1` and we upgrade, we are ok with `4.5.3` or `4.8.2`. We are not bothered about the minor or patch version.

This is equivalent to `4.x`

Tilde

Interested in any patch version within set major and minor parameters. For example `~1.8.3` means you don't mind any patch version so long as it is a patch for `1.8`. This is equivalent to `1.8.x`.

No tilde or caret

Use the *exact* version specified
